

Gum Therapy That You Don't Have to Fear...

Laser Treatment

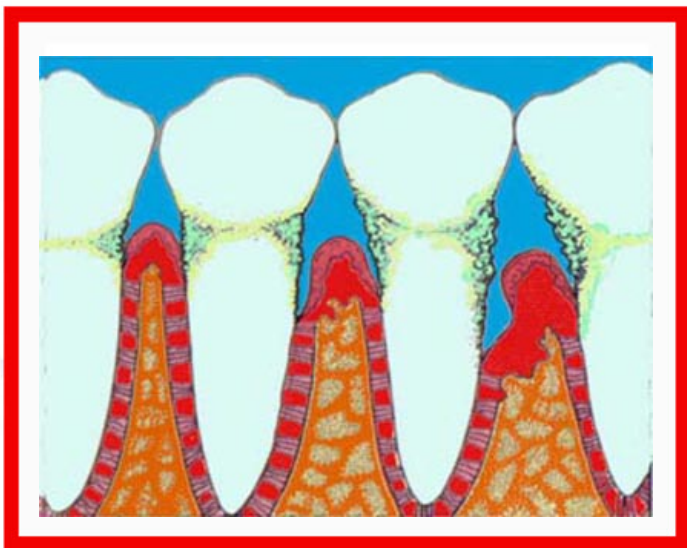

What is Laser Gum Treatment?

Laser treatment is an advanced technique for your doctor to treat periodontal (gum) disease and save many teeth that were previously considered hopeless. A laser light is used to gently remove harmful bacteria and diseased tissue from the gum pocket. This allows the body to heal naturally so that the gum pockets improve and the teeth become more stable. The laser is a wonderful tool that will help many patients bring themselves to a more healthy state.

Dramatic Patient Benefits

- Dramatically less traumatic yet highly effective alternative to cut and sew gum surgery.
- No cutting of the gum tissue with a scalpel and no stitches means easy recovery with minimal bleeding.
- Preserves gum tissue instead of cutting it away.
- Reduces root exposure and sensitivity.
- Reduces infection.
- Reasonable expense.

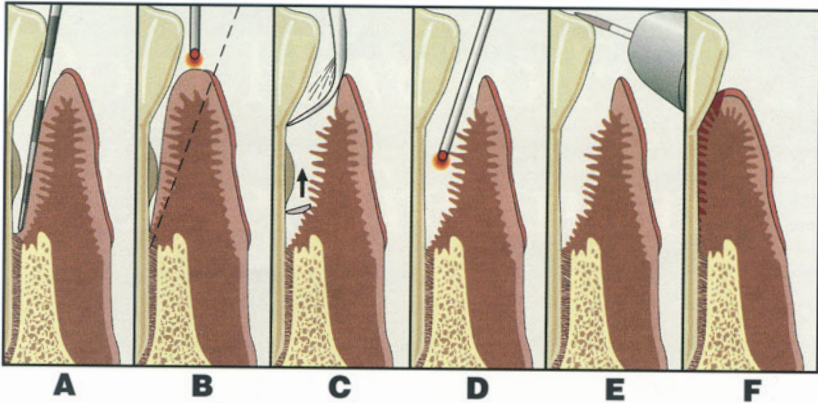

Who Is A Candidate For This Therapy?

First it is helpful to know who is not a candidate for Laser Gum Treatment. Patients who have healthy gums do not need this treatment. Also, people with superficial gingivitis do not need this form of therapy. Superficial gingivitis patients have red swollen gums but have gum pockets less than 5mm. These patients are classified as Class I. All other periodontal patients are Class II, Class III, or Class IV. All these people have gum pockets 5mm or greater, and the higher classes of gum disease correspond to deeper gum pockets, and more loss of bone support to the teeth. All classes of gum disease greater than Class I are candidates for Laser Gum Treatment.

Laser treatment procedure

- A) Perio Probe indicating excessive pocket depth
- B) Laser radiations vaporizes bacteria, diseased tissue, pathologic proteins and alerts the practitioner to the presence of tartar.
- C) Ultrasonic scaler and special hand instruments used to remove root surface deposits
- D) Laser finishes debriding pockets and aids into coagulation
- E) Occlusal trauma adjusted
- F) Reattachment to clean surface with a stable fibrin clot at the gingival crest to create a "closed system".

The Mp7 Nd-Yag Laser From Millenium Dental Technologies is the only laser approved by the FDA rto perform this procedure to treat periodontal disease.

The Protocol is performed by highly trained professionals, Dr. Mokbel has reached the level of Fellow in the Accademy of Laser Dentistry.

If you have gum disease and you have been told that you need gum surgery, you need to find more about this revolutionary new technology before you go under the knife.
